

## CHA Foundation Suite ROI

# Increase efficiency, patient satisfaction, and institutional ROI with CHA's Foundation Suite

### **Reduce length of stay & re-admission risk**

The CHA Foundation Suite can help you do that and more. Through our predictive analytics model that leverages a number of clinical protocols, you'll have the ability to show an increase of billable diagnosis codes. Not only do these protocols identify patients that may be moving into an acute disease state and allow interventions to stop the progression, but they also allow your institution to realize additional funds through the diagnosis of these acute states within the patient's chart.

### **Improve clinical care and reduce acute care services:**

- Faster identification of patients moving into acute disease states, allowing for medical intervention.
- Increased revenue through the ability to charge for CHA clinical protocol diagnosis (kidney diagnosis due to AKI protocol).
- Early warning allows for patient care to be addressed before more complex levels of care are required:
  - Create a reduction of timeline for patient care
  - Keep patient care simple and inexpensive

## Address sub-acute disease states before they become an acute condition will help prevent possible readmission:

- By using the modified LACE score, we are proactively using the “Best Case” clinical experience to reduce readmission risk.
- As the government, medical, and CHA communities identify new and better standards, CHA will build them into the system automatically to help continue to reduce readmission risk.
- The readmission module will help reduce patient readmission and help healthcare institutions, currently being fined by the government, to reduce or eliminate those fines.

## Reduce length of stay:

- By using CHA’s Discharge Readiness protocol, nurses, case managers, and physicians will be able to prioritize patient care workflows and attend to patients ready for discharge, helping to focus their time and reduce the LOS for the patient.
- LOS reduction will translate directly to a cost savings for all CHA clients.
- Patient satisfaction will increase due to the reduction of wasted time waiting for staff to complete paperwork.
- By combining CHA Discharge Readiness and acuity of stay, nurses get patients quickly out of Observation beds into traditional IP beds.

## Increase revenue by improving accuracy in assigning the proper level of care:

- RADAR, CHA’s Real-time Aid to Detection of At-Risk Patients Surveillance Dashboard, analyzes complex data sets to maintain an up-to-the-minute overview of the patient population.
